Project Details

Project Name: Portfolio deployment

Deployed URL: <https://Ccspoet.github.io/charlottesigei.github.io>

GitHub Repository: <https://github.com/Ccspoet/charlottesigei.github.io>

Summary

The site was built on a BootstrapMade HTML/CSS/JS template and all eight pages were customized. On `index.html`, the hero background was replaced with a personal photograph and the `Typed.js` animation was configured with four role strings via the `data-typed-items` attribute: *Data Scientist*, *Quantitative Risk Analyst*, *Actuarial Professional*, and *AIMS Scholar*.

On `about.html`, the `PureCounter.js` stat counters were set to real values: 450+ farmers onboarded, 3 years of experience, 2 industries, 3 projects and six animated `progress-bar` elements were configured with `aria-valuenow` attributes reflecting my actual skill proficiencies in Python, R, SQL, Machine Learning, Financial Modeling, and Stochastic Processes.

On `portfolio.html`, I defined three custom Isotope filter categories (`.filter-ml`, `.filter-agritech`, `.filter-agriculture`) and populated 12 project cards with real images. The twelfth card uses an HTML5 `<video>` element with `autoplay`, `muted`, `loop`, and `playsinline` attributes, pointing to `vid1.mp4`, styled with `object-fit: cover` to match the surrounding image grid. On `resume.html`, my full academic history and four professional roles were added across two Bootstrap columns, including specific contributions at the Affordable Housing Board and AgriSync Lab.

The `services.html` and `service-details.html` pages were rewritten around six professional capability areas, each assigned a Bootstrap Icons glyph. The `contact.html` page was updated with real contact details across two countries and working social links.

The site was deployed entirely via the command line: a local Git repository was initialized, a GitHub Personal Access Token was used for authentication, and the codebase was pushed to the `main` branch before configuring GitHub Pages to serve from the repository root.
